

These Comments are regarding the Fcc Policy. FCC task force recently invited Comments on The effective use of Broadband Spectrum and of unused TV channels in promoting WISP> I don't know if the taskforce report alluded to herein refers to the Task force report on those Comments.

But the fcc policy on the spectrum allows the concentration of atleast the most desirable spectrums in the hands of a choosen few multinationals like baby bells or their subsidieries. At this time one of these Chosen few multinationals is Cingular which is the subsidiary of two baby Bells SBC Communications and Northeastern (whatever the name is but it is a baby Bell) . It acquired the loss producing Operations AT&T Wireless (I don't know if AT&T Wireless owned any spectrum) for close to \$41 Mil. Cingular also acquired the spectrums of Nextwave Communications (with Fcc blessing).

This is hampering the development of a true wireless internet service that could be delivered by the use of wireless handheldevice now catching dust on the shelves of the retailers.

Instead of wasting time on the collection of comments and on reviewing them Fcc should recognize that the stage of development of Wireless Internet service has fallen way behind the stage of development of the wireless intenet service and issue a declaration that the spectrums are being abused by the multinationals like Baby Bells. Fcc should not allow any of the multinationals, including the Baby Bells to acquire any more spectrums unless they are for the express purpose of delivery of Internet service by the use of Wireless handheld devices now on the shelves of the retailers.
